1. SCOPE
The purpose of this specification is to define the general provisions and quality requirements that apply to the supply of display cells manufactured by RiTdisplay. This document, together with the Module Assembly Drawing, is the highest-level specification for this product. It describes the product, identifies supporting documents and contains specifications.

2. WARRANTY
RiTdisplay warrants that the products delivered pursuant to this specification (or order) will conform to the agreed specifications for twelve (12) months from the shipping date ("Warranty Period"). RiTdisplay is obligated to repair or replace the products which are found to be defective or inconsistent with the specifications during the Warranty Period without charge, on condition that the products are stored or used as the conditions specified in the specifications. Nevertheless, RiTdisplay is not obligated to repair or replace the products without charge if the defects or inconsistency are caused by the force majeure or the reckless behaviors of the customer.
After the Warranty Period, all repairs or replacements of the products are subject to charge.

3. FEATURES
- Small molecular organic light emitting diode.
- Color : Yellow
- Panel resolution : 128*64
- Driver IC : SPD0301
- Excellent Quick response time : 10μs
- Extremely thin thickness for best mechanism design : 2.027 mm
- High contrast : 2000:1
- Wide viewing angle : 160°
- Strong environmental resistance.
- 8-bit 6800/8080-series parallel interface, Serial Peripheral Interface, I²C Interface.
- Wide range of operating temperature : -40 to 70°C
- Anti-glare polarizer.

7.4 GRAPHIC DISPLAY DATA RAM ADDRESS MAP

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 128 x 64 bits and the RAM is divided into eight pages, from PAGE0 to PAGE7, which are used for monochrome 128x64 dot matrix display, as shown in below figures.

<table>
<thead>
<tr>
<th>GDDRAM pages structure of SPD0301</th>
<th>Row re-mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAGE0 (COM0-COM47)</td>
<td>PAGE0 (COM 63-COM56)</td>
</tr>
<tr>
<td>PAGE1 (COM8-COM15)</td>
<td>PAGE1 (COM 55-COM48)</td>
</tr>
<tr>
<td>PAGE2 (COM16-COM23)</td>
<td>PAGE2 (COM47-COM40)</td>
</tr>
<tr>
<td>PAGE3 (COM24-COM31)</td>
<td>PAGE3 (COM39-COM32)</td>
</tr>
<tr>
<td>PAGE4 (COM32-COM39)</td>
<td>PAGE4 (COM31-COM24)</td>
</tr>
<tr>
<td>PAGE5 (COM40-COM47)</td>
<td>PAGE5 (COM23-COM16)</td>
</tr>
<tr>
<td>PAGE6 (COM48-COM55)</td>
<td>PAGE6 (COM15-COM8)</td>
</tr>
<tr>
<td>PAGE7 (COM56-COM63)</td>
<td>PAGE7 (COM 7-COM0)</td>
</tr>
<tr>
<td>Column re-mapping</td>
<td>SEG0 ------------------------ SEG127</td>
</tr>
<tr>
<td></td>
<td>SEG127------------------------ SEG0</td>
</tr>
</tbody>
</table>

When one data byte is written into GDDRAM, all the rows image data of the same page of the current column are filled (i.e. the whole column (8 bits) pointed by the column address pointer is filled.). Data bit D0 is written into the top row, while data bit D7 is written into bottom row as shown in below figures.

For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software.

For vertical shifting of the display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display (command D3h).

8080-series parallel interface characteristics

**Write cycle**

**Read Cycle**
8. POWER ON / OFF SEQUENCE & APPLICATION CIRCUIT

8.1 POWER ON / OFF SEQUENCE

The following figures illustrate the recommended power ON and power OFF sequence of SPD0301

**Power ON sequence:**
1. Power ON V_{DD}
2. After V_{DD} become stable, set RES# pin LOW (logic low) for at least 3us (t\_1) \(^{(3)}\) and then HIGH (logic high).
3. After set RES# pin LOW (logic low), wait for at least 3us (t\_2). Then Power ON V_{CC}. \(^{(1)}\)
4. After V_{CC} become stable, send command AFh for display ON. SEG/COM will be ON after 100ms (t\_AF).

![The Power ON sequence](image)

**Power OFF sequence:**
1. Send command AEh for display OFF.
2. Power OFF V_{CC} \(^{(1)}, (2)\)
3. Power OFF V_{DD} after t\_OFF. \(^{(4)}\) (where Minimum t_{OFF}=80ms, Typical t_{OFF}=100ms)

![The Power OFF sequence](image)

**Note:**
\(^{(1)}\) V_{CC} should be disabled when it is OFF.
\(^{(2)}\) Power Pins (V_{DD}, V_{CC}) can never be pulled to ground under any circumstance.
\(^{(3)}\) The register values are reset after t\_1.
\(^{(4)}\) V_{DD} should not be Power OFF before V_{CC} Power OFF.
8.2 APPLICATION CIRCUIT

Component:
C1, C3: 4.7uF/35V(Tantalum type) or VISHAY (572D475X0025A2T)
C2: 1uF/16V(0603)
R1: 1M ohm (0603) 1%

This circuit is for 8080 8bits interface

12. APPENDIXES

APPENDIX 1: DEFINITIONS

A. DEFINITION OF CHROMATICITY COORDINATE

The chromaticity coordinate is defined as the coordinate value on the CIE 1931 color chart for R, G, B, W.

B. DEFINITION OF CONTRAST RATIO

The contrast ratio is defined as the following formula:

\[
\text{Contrast Ratio} = \frac{\text{Luminance of all pixels on measurement}}{\text{Luminance of all pixels off measurement}}
\]

C. DEFINITION OF RESPONSE TIME

The definition of turn-on response time \( T_r \) is the time interval between a pixel reaching 10% of steady state luminance and 90% of steady state luminance. The definition of turn-off response time \( T_f \) is the time interval between a pixel reaching 90% of steady state luminance and 10% of steady state luminance. It is shown in Figure 2.

![Figure 2 Response time](http://www.ritdisplay.com)
D. DEFINITION OF VIEWING ANGLE

The viewing angle is defined as Figure 3. Horizontal and vertical (H & V) angles are determined for viewing directions where luminance varies by 50% of the perpendicular value.

\[ \theta = 0^\circ \]
\[ \phi = 0^\circ \]

APPENDIX 3: PRECAUTIONS FOR USING THE OLED MODULE

Precautions for Handling

1. When handling the module, wear powder-free antistatic rubber finger cots, and be careful not to bend and twist it.

2. The OLED module is consisted of glass and film, and it should avoid pressure, strong impact, or being dropped from a high position.

3. The OLED module is an electronic component and is subject to damage caused by Electro Static Discharge (ESD). And hence normal ESD precautions must be taken when handling it. Also, appropriate ESD protective environment must be administered and maintained in the production line. When handling and assembling the panel, wear an antistatic wrist strap with the alligator clip attached to the ground to prevent ESD damage on the panel. Also, ground the tools being used for panel assembly and make sure the working environment is not too dry to cause ESD problems. Antistatic wrist strap should touch human body directly instead of gloves. (See below photos).

4. Take out the panel one by one from the holding trays for assembly, and never put the panel on top of another one to avoid the scratch.

5. Avoid jerk and excessive bend on TAB/FPC/COF, and be careful not to let foreign matter or bezel damage the film.

6. When handling and assembling the module (panel + IC), grab the panel, not the TAB/FPC/COF.

7. Use the tweezers to open the clicks on the connector of PCB before the insertion of FPC/COF, and click them back in. Once the FPC/COF sits properly in the connector, use the tweezers to avoid the damages.
8. Please do not bend the film near the substrate glass. It could cause film peeling and TAB/FPC/COF damage. For TAB, it should bend the slit area as actual OLED it is. For FPC or COF, it is suggested to follow below pictures for instruction (distance between substrate glass and bending area >1.5mm; R>0.5mm).
9. Avoid bending the film at IC bonding area. It could damage the IC ILB bonding. It should avoid bending the IC seal area. Please keep the bending distance >1.5mm.

10. Use both thumbs to insert COF into the connector when assembling the panel. Please refer to the photo.

11. The working area for the panel should be kept clean. If the panel is accidentally dropped on the floor, do visual inspection of the panel first. Please use clean-room wiping cloth moistened with alcohol to wipe it off if dirt or grease stains the panel.
12. Do not wipe the pin of film and polarizer with the dry or hard materials that will damage the surface. When cleaning the display surface, use the soft cloth with solvent, IPA or alcohol, to clean.

13. Protection film is applied to the surface of OLED panel to avoid the scratch. Please remove the protective film before assembling it. If the OLED panel has been stored for a long time, the residue adhesive material of the protective film may remain on the display surface after remove the protective film. Please use the soft cloth with solvent, IPA or alcohol, to clean.

14. When hand or hot-bar soldering TAB/FPC onto PCB, make sure the temperature and timing profiles to meet the requirements of soldering specification (the specification depends on the application or optimized by customer) to prevent the damage of IC pins by inappropriate soldering.

15. Solder residues arise from soldering process have to be cleaned up thoroughly before the module assembly.

16. Use the voltage and current settings listed in the specification to do the function test after the module assembly.

17. Suggestion for soldering process:
   i. TAB Lead- free soldering hot bar process
      1. Use pulse heated bonding tool equipment
      2. Material: Sn/Ag/Cu lead-free solder paste with typical 25um thickness on PCB pad. The TAB pin size and shape may be different, please base on the production line to adjust the thickness of PCB pad and temperature.
      3. Bonding Force:---4kg per centimeter square as the starting point.
      4. Suggested bonding tool temperature & time profile is as below for reference. Since there are differences in TAB soldering pins, soldering technicians’ skills, mechanism…etc., the soldering conditions must be adequately tuned.
ii. TAB Lead- free soldering wire process
   In case of manual soldering (Lead- free solder wire)
   1. Solder wire contact iron directly: 280±5°C at 3-5secs
   2. Solder wire contact TAB lead directly (near iron but not contact):
      380±5°C, 3-5secs
   3. Since there are differences in TAB soldering pins, soldering technicians’ skills, mechanism...etc., the soldering conditions must be adequately tuned.

iii. High temperature will result in rapid heat conduction to IC and might cause damage to IC, so please keep the temperature below 380°C. Also, avoid damaging the polyimide and solder resist which might take place at high temperatures. Refold cycles base on the de-soldering status, if the plating of pin was damaged, it can not be used again.
Precautions for Electrical

1. Design using the settings in the specification
   It is very important to design and operate the panel using the settings listed in the specification. It includes voltage, current, frame rate and duty cycle... etc. Operation the OLED outside the range of the specification should be entirely avoided to ensure proper operation of the OLED.

2. Maximum Ratings
   To ensure the proper operation of the panel, never design the panel with parameters running over the maximum ratings listed in the specification. Also the logic voltages such as VIL and VIH have to be within the specified range in the specification to prevent any improper operation of the panel.

3. Power on/off procedure
   To avoid any inadvertent effects resulting from inappropriate power on/off operations, please follow the directions of power on/off procedure on page 6. Any operation that does not comply with the procedure could cause permanent damage of the IC and should be avoided. When the logic power is not on, do not activate any input signal. Abrupt shutdown of power to the module, while the OLED panel is on, would cause OLED panel malfunction.

![Flowchart for power on/off procedure]
4. Power savings

To save power consumption of the OLED, please use partial display or sleep mode when the panel is not fully activated. Also, if possible, make the black background to save power.

The OLED is a self-luminous device and a particular pixel cluster or image can be lit on via software control. So power savings can be achieved by partial display or dimming down the luminance. Depending on the application, the user can choose among Ultra Bright Mode, Normal Operation Mode, and Sleeping Mode. The power consumption is almost in directly proportion to the brightness of the panel, and also in directly proportion to the number of pixels lit on the panel. The customer can save the power by the use of black background and sleeping mode. One benefit from using these design schemes is the extension of the OLED lifetime.

5. Adjusting the luminance of the panel

Although there are a couple of ways to adjust the luminance of the panel, it is strongly recommended that the customer change the contrast setting to adjust the luminance of the panel. Adjusting voltages to achieve desired luminance is not allowed. Be aware that the adjustment of luminance would accompany the change of lifetime of the panel and its power consumption as well.

6. Residual Image (Image Sticking)

The OLED is a self-emissive device. As with other self-emissive device or displays consisting of self-emissive pixels, when a static image frozen for a long period of time is changed to another one with all-pixels-on background, residual image or image sticking is noticed by the human eye. Image sticking is due to the luminance difference or contrast between the pixels that were previously turned on and the pixels that are newly turned on. Image sticking depends on the luminance decay curve of the display. The slower the decay, the less prominent the image sticking is. It is strongly recommended that the user employ the following three strategies to minimize image sticking.
1. Employ image scrolling or animation to even out the lit-on time of each and every pixel on the display, also could use sleeping mode for reduced the residual image and extend the power capacity.

2. Minimize the use of all-pixels-on or full white background in their application because when the panel is turned on full white, the image sticking from previously shown patterns is the most revealing. Black background is the best for power savings, greatest visibility, eye appealing, and dazzling displays.

3. If a static logo is used in the reliability test, change the pattern into its inverse (i.e., turn off the white pixels and turn on the previously unlit pixels) and freeze the inverse pattern as long as the original logo is used, so every pixel on the panel can be lit on for about the same time to minimize image sticking, caused by the differential turn-on time between the original and its reverse patterns.

Frame5

Example: `setup and start`

```
comm_out2(0x26); //scrolling setup
comm_out2(0x08); //scrolling numbers/step
comm_out2(0x00); //start page
comm_out2(0x08); //scrolling step/frame
comm_out2(0x08); //end page
comm_out2(0x2F); //start
```

Example: `stop`

```
comm_out2(0x2E); //stop
```
Precautions for Mechanical

1. Cushion or Buffer tape on the cover glass
   It is strongly recommended to have a cushion or buffer tape to apply on the panel backside and front side when assembling OLED panel into module to protect it from damage due to excessive extraneous forces.

![Image](http://www.ritdisplay.com)

   It is recommended that a plating conductive layer be used in the housing for EMI/EMC protection. And, the enough space should be reserved for the IC placement if the IC thickness is thicker than the TAB film when customer design the PCB.

2. Avoid excessive bending of film when handling or designing the panel into the product
   The bending of TAB/COF/FPC has to follow the precautions indicated in the specification, extra bending or excessive extraneous forces should be avoided to minimize the chances of film damage. If bending the film is necessary, please bend the designated bending area only. Please refer to items 8 and 9 of Precautions for Handling for more information.
Precautions for Storage and Reliability Test

1. Storage
   Store the packed cartons or packages at 25°C±5°C, 55%±10%RH. Do not store the OLED module under direct sunlight or UV light. For best panel performance, unpack the cartons and start the production of the panels within six months after the reception of them.

2. Reliability Test
   RiTdisplay only guarantees the reliability of the OLEDs under the test conditions and durations listed in the specification.
